Table 6: Estimation Result when $R = 1000$

variable	estimates
$E[X^2]$	5.90099
R	1000

Answer to Question 3-2: Graph Part

```
# check dependency on the number of R
res_df = data.frame(matrix(ncol = 2, nrow = 0))
colnames(res_df) <- c("R", "estimated_E_X2")

i = 0
for (r in seq(from = 100, to = 50000, by = 100)) {
  i = i + 1

  res_E_X2_hat_r <- compute_E_X2_hat(r)

  # Store result
  res_df[i, 1] <- r
  res_df[i, 2] <- res_E_X2_hat_r
}

# Plot R and estimates
ggplot(res_df, aes(x = R, y = estimated_E_X2)) +
  geom_point() +
  labs(x = "R", y = "estimated_E_X2") +
  theme_minimal()
```

```
ggsave("./figure/Q3_2_MC.pdf", device = "pdf")
```

```
## Saving 6.5 x 4.5 in image
```
